Integral Wikipedia

In mathematics an integral assigns numbers to functions in a way that can describe displacement area volume and other concepts that arise by combining infinitesimal data Integration is one of the two main operations of calculus with its inverse operation differentiation being the other Given a function f of a real variable x and an interval a b of the real line the definite integral

Pi Wikipedia

In addition to being irrational more strongly π is a transcendental number which means that it is not the solution of any non constant polynomial equation with rational coefficients such as $x^5 - 120x^3 + 6x - 0$ The transcendence of π has two important consequences First π cannot be expressed using any finite combination of rational numbers and square roots or n th roots such

Example 16 Evaluating Cash Flow Transactions Consider a cash flow transaction between two decision makers A and B Assume that decision maker B is a bank and proposes the cash flow stream x to A Let x be a discrete cash flow stream with cash flow vector $x = [100, -110]$ corresponding to an initial payment of 100 as loan principal from B to A followed by a repayment of 110 from A to B in

antilinear - Wikipedia

antilinear is a linear transformation T between two vector spaces V and W over a field F such that $T(ax + by) = aT(x) + bT(y)$ for all $x, y \in V$ and $a, b \in F$. The key property is that the scalars a and b are conjugated in the field. For example, if $F = \mathbb{C}$, then $T(ax + by) = aT(x) + \overline{b}T(y)$. This is in contrast to a linear transformation where the scalars are not conjugated: $T(ax + by) = aT(x) + bT(y)$. Antilinear transformations are common in quantum mechanics, particularly in the context of complex vector spaces and inner products.
